

$a \equiv b \pmod{m}$  means  $m \mid a-b$   
 $m$  divides  $a-b$

if  $m=5$

0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16

$$\begin{aligned}0 &\equiv 5 \equiv 10 \equiv 15 \equiv \dots \pmod{5} \\1 &\equiv 6 \equiv 11 \equiv 16 \equiv \dots \pmod{5} \\2 &\equiv 7 \equiv \dots \pmod{5} \\3 &\equiv 8 \equiv \dots \pmod{5} \\4 &\equiv \dots \pmod{5}\end{aligned}$$

Given any  $m$  natural number  $0, 1, 2, 3, \dots, m-1$  they are all distinct mod  $m$   
 $0 \leq a, b \leq m-1$

if  $a \neq b$ , say  $a < b$

then  $0 < b-a < m \Rightarrow b-a$  is not divisible by  $m$ .

for any  $a$ -natural numbers  $\Rightarrow$  there is  $0 \leq b \leq m-1$   
such that  $a \equiv b \pmod{m}$

$\Rightarrow$  there are exactly  $m$  possible equivalence cases mod  $m$   
because we can divide with remainder  
given  $a \Rightarrow$  divide  $a$  by  $m$  with remainder

$$a = qm + r \quad \xrightarrow{\text{remainder}} a \equiv r \pmod{m}$$

$$\begin{aligned}\text{ex: } 263 &\equiv 3 \pmod{5} \\263 &= 260 + 3 = 52 \cdot 5 + 3 \\0 \leq 3 &\leq 4\end{aligned}$$

Last time: a number is divisible by 9  $\Leftrightarrow$  the sum of its digits is divisible by 9

divisibility by 11     $n = \overline{a_k a_{k-1} \dots a_0}$   
 $a_i$  - digits of  $n$   
 $0 \leq a_i \leq 9$

Claim:  $n$  is divisible by 11  $\Leftrightarrow a_0 - a_1 + a_2 - a_3 + \dots + (-1)^k a_k$  is divisible by 11.

$$\begin{aligned}\text{ex: } 121 &= 11^2 \\1-2+1 &= 0 \text{ divisible by 11} \\99 &\text{ is divisible by 11} \\20801 : 2 &- 0 + 8 - 0 + 2 = 1\end{aligned}$$

$$\begin{aligned}
 10^0 &\equiv 1 \pmod{11} \\
 10 &\equiv -1 \pmod{11} \\
 10^2 &\equiv (-1)^2 \equiv +1 \pmod{11} \\
 10^3 &\equiv (-1)^3 \equiv -1 \pmod{11} \\
 &\dots \\
 10^k &\equiv (-1)^k \pmod{11}
 \end{aligned}$$

$$\begin{aligned}
 n &= a_0 + 10^1 a_1 + 10^2 a_2 + \dots + 10^k a_k \\
 237 &= 7 + 3 \cdot 10^1 + 2 \cdot 10^2 \\
 10^k &\equiv (-1)^k \pmod{11} \\
 10^k a_k &\equiv (-1)^k a_k \pmod{11}
 \end{aligned}$$

$$n = a_0 + 10^1 a_1 + \dots + 10^k a_k \equiv a_0 - a_1 + a_2 - \dots + (-1)^k a_k \pmod{11}$$

mod 7

$$\begin{aligned}
 n &= a_0 + a_1 \cdot 10^1 + \dots + a_k \cdot 10^k \\
 10^0 &\equiv 1 \pmod{7} \\
 10^1 &\equiv 3 \pmod{7} \\
 10^2 &\equiv 3 \cdot 3 = 9 \equiv 2 \pmod{7} \\
 10^3 &\equiv 3 \cdot 2 = 6 \pmod{7} \equiv -1 \pmod{7} \\
 10^4 &\equiv (-1) \cdot 3 \equiv -3 \pmod{7} \\
 10^5 &\equiv 4 \cdot 3 = 12 \equiv 5 \pmod{7} \\
 10^6 &\equiv 5 \cdot 3 = 15 \equiv 1 \pmod{7}
 \end{aligned}$$

$$\begin{aligned}
 10^{6k} &\equiv 1 \pmod{7} \\
 10^{6k+1} &\equiv 3 \pmod{7} \\
 10^{6k+2} &\equiv 2 \pmod{7} \\
 10^{6k+3} &\equiv -1 \pmod{7} \\
 10^{6k+4} &\equiv -3 \pmod{7} \\
 10^{6k+5} &\equiv -2 \pmod{7}
 \end{aligned}$$

$$\begin{aligned}
 n &= a_0 + 10^1 a_1 + 10^2 a_2 + 10^3 a_3 + \dots \\
 &\equiv a_0 + 3a_1 + 2a_2 - a_3 - 3a_4 - 2a_5 + a_6 + 3a_7 + 2a_8 \dots \pmod{7}
 \end{aligned}$$

We proved by induction that

$n^3 + 5n$  is divisible by 3 for any  $n$ .

Different proof using modular arithmetic

Look at  $n \pmod{3}$ : 0, 1, 2 are all possible values

$$\begin{aligned}
 n &\equiv 0 \pmod{3} & \text{or} \\
 \text{i.e. } n &\text{ is divisible by 3} \\
 \Rightarrow n^3 + 5n &\text{ is also divisible by 3}
 \end{aligned}$$

$$\begin{aligned}
 n &\equiv 1 \pmod{3} \\
 n^3 &\equiv 1^3 \pmod{3} \\
 n^3 &\equiv 1 \pmod{3} \\
 5n &\equiv 5 \cdot 1 \equiv 5 \pmod{3} \\
 n^3 + 5n &\equiv 1 + 5 \equiv 6 \equiv 0 \pmod{3}
 \end{aligned}$$

$$\begin{aligned}
 n &\equiv -1 \pmod{3} \\
 n^3 &\equiv (-1)^3 \equiv -1 \pmod{3} \\
 5n &\equiv -5 \pmod{3} \\
 n^3 + 5n &\equiv -1 + (-5) \\
 &\equiv -6 \\
 &\equiv 0 \pmod{3}
 \end{aligned}$$

Ex:

Prove that 10003 can not be written as  $a^2 + b^2$  where  $a, b$  are natural numbers.

Hint: consider numbers mod 4

If  $a$  is an integer what values can  $a^2 \pmod{4}$  take?

All possible numbers mod 4 are 0, 1, 2, 3

$$a \equiv 0 \pmod{4} \Rightarrow a^2 \equiv 0^2 \equiv 0 \pmod{4}$$

$$\begin{array}{ll}
 1 & 1 \equiv 1 \pmod{4} \\
 2 & 4 \equiv 0 \pmod{4} \\
 3 & 9 \equiv 1 \pmod{4}
 \end{array}$$

For any  $a \Rightarrow a^2 \equiv 0$  or  $1 \pmod{4}$

$$\begin{array}{ll} a^2 + b^2 & \text{can be } 0+0=0 \\ a, b \text{ any integers} & 0+1=1 \\ & 1+0=1 \\ & 1+1=2 \end{array}$$

$a^2 + b^2$  can only be  $0, 1, 2$  or  $4$   
but cannot be  $3 \pmod{4}$ .

$$\begin{aligned} 10003 &= 10000 + 3 \equiv 3 \pmod{4} \\ &\quad \hookrightarrow \text{divisible by 4} \\ \Rightarrow &\text{cannot write it as } a^2 + b^2 \end{aligned}$$
